

## Chapter 2

# Discrete-Time Signals and Systems

1. (i)

$$x(n) = \begin{cases} 3^n & n < 0 \\ 0.7^n & n \geq 0 \end{cases}$$

$$\begin{aligned} \Rightarrow X(z) &= \sum_{n=-\infty}^{-1} 3^n z^{-n} + \sum_{n=0}^{\infty} 0.7^n z^{-n} = \sum_{n=1}^{\infty} (3^{-1}z)^n + \sum_{n=0}^{\infty} (0.7z^{-1})^n \\ &= \frac{z}{3-z} + \frac{z}{z-0.7} \end{aligned}$$

And region of convergence is

$$0.7 < |z| < 3$$

(ii)

$$x(n) = \begin{cases} 2^n & n < 0 \\ 0.7^n & 0 \leq n < 5 \\ 0.5^n & n \geq 5 \end{cases}$$

and thus

$$\begin{aligned} X(z) &= \sum_{n=-\infty}^{\infty} x(n)z^{-n} = \sum_{n=-\infty}^{-1} 2^n z^{-n} + \sum_{n=0}^4 0.7^n z^{-n} + \sum_{n=5}^{\infty} 0.5^n z^{-n} \\ &= \sum_{n=1}^{\infty} (2^{-1}z)^n + \sum_{n=0}^4 (0.7z^{-1})^n + \sum_{n=5}^{\infty} (0.5z^{-1})^n \\ &= \frac{z}{2-z} + \frac{1 - (0.7z^{-1})^5}{1 - 0.7z^{-1}} + \frac{(0.5z^{-1})^5}{1 - 0.5z^{-1}} \end{aligned}$$

for

$$0.5 < |z| < 2$$

2. By method of partial fraction,

$$H(z) = \frac{1}{(1 - 0.5z^{-1})(1 - 2z^{-1})} = \frac{A}{1 - 0.5z^{-1}} + \frac{B}{1 - 2z^{-1}},$$

where  $A = -\frac{1}{3}$  and  $B = \frac{4}{3}$ .

(i) When the region of convergence is I, both terms on the right hand side are z-transform of a left-sided sequence. We thus get

$$\frac{A}{1 - 0.5z^{-1}} = -A \sum_{n=-\infty}^{-1} 0.5^n z^{-n},$$

$$\frac{B}{1 - 2z^{-1}} = -B \sum_{n=-\infty}^{-1} 2^n z^{-n}$$

and

$$h(n) = \begin{cases} 0 & n \geq 0 \\ \frac{1}{3} \times 0.5^n - \frac{4}{3} \times 2^n & n < 0. \end{cases}$$

(ii) When the region of convergence is II, the first corresponds to a right-sided sequence and the second term to a left-sided sequence. We thus get

$$\frac{A}{1 - 0.5z^{-1}} = A \sum_{n=0}^{\infty} 0.5^n z^{-n},$$

$$\frac{B}{1 - 2z^{-1}} = \frac{-B \times 0.5z}{1 - 0.5z} = -B \times 0.5z \sum_{n=0}^{\infty} 0.5^n z^n$$

$$= -B \sum_{n=1}^{\infty} 0.5^n z^n = -B \sum_{n=-\infty}^{-1} 0.5^{-n} z^{-n} = -B \sum_{n=-\infty}^{-1} 2^n z^{-n}$$

and

$$h(n) = \begin{cases} -\frac{1}{3} \times 0.5^n & n \geq 0 \\ \frac{4}{3} \times 2^n & n < 0. \end{cases}$$

(iii) When the region of the convergence is III, both terms corresponds to a right sided sequence. We thus get

$$\frac{A}{1 - 0.5z^{-1}} = A \sum_{n=0}^{\infty} 0.5^n z^{-n},$$

$$\frac{B}{1 - 2z^{-1}} = B \sum_{n=0}^{\infty} 2^n z^{-n}$$

and

$$h(n) = \begin{cases} -\frac{1}{3} \times 0.5^n + \frac{4}{3} \times 2^n & n \geq 0 \\ 0 & n < 0. \end{cases}$$

3. From (2.43),

$$\phi_{xx}(k) = r_{xx}(k) + |m_x|^2.$$

Taking z-transform from both sides,

$$\Phi_{xx}(z) = \sum_{k=-\infty}^{\infty} r_{xx}(k)z^{-k} + |m_x|^2 \sum_{k=-\infty}^{\infty} z^{-k}.$$

We note that

$$\sum_{k=-\infty}^{\infty} z^{-k} = \sum_{k=-\infty}^{-1} z^{-k} + \sum_{k=0}^{\infty} z^{-k}$$

and for this to be convergent,  $|z| > 1$  for the first term on the right side, and  $|z| < 1$  for the second term. Clearly there is no region of  $z$  for which  $\sum_{k=-\infty}^{\infty} z^{-k}$  is convergent.

4. Applying (2.38),

$$\begin{aligned} \phi_{xx}(k) &= \phi_{vv}(k) + E[\sin(\omega_0 n + \theta) \sin(\omega_0(n - k) + \theta)] \\ &= \sigma_v^2 \delta(k) + E\left[\frac{1}{2} \cos(\omega_0 k) - \frac{1}{2} \cos(\omega_0(2n - k) + 2\theta)\right] = \sigma_v^2 \delta(k) + \frac{1}{2} \cos \omega_0 k \end{aligned}$$

where  $\sigma_v^2 = E[|v(n)|^2]$  Hence,

$$\Phi_{xx}(z) = \sigma_v^2 + \frac{1}{2} \sum_{k=-\infty}^{\infty} \cos \omega_0 k z^{-k}$$

and

$$\frac{1}{2} \sum_{k=-\infty}^{\infty} \cos \omega_0 k z^{-k} = \frac{1}{4} \left[ \sum_{k=-\infty}^{\infty} e^{j\omega_0 k} z^{-k} + \sum_{k=-\infty}^{\infty} e^{-j\omega_0 k} z^{-k} \right]$$

In a similar way to the proof given in Problem 2.5, we can show that here also there is no region of z-plane in which either of summation on the right side of the above equation may converge.

5. (i) From (2.43),

$$\phi_{xx}(k) = r_{xx}(k) + |m_x|^2.$$

Taking z-transform from both sides,

$$\Phi_{xx}(z) = \sum_{k=-\infty}^{\infty} r_{xx}(k)z^{-k} + |m_x|^2 \sum_{k=-\infty}^{\infty} z^{-k}.$$

We note that

$$\sum_{k=-\infty}^{\infty} z^{-k} = \sum_{k=-\infty}^{-1} z^{-k} + \sum_{k=0}^{\infty} z^{-k}$$

and for this to be convergent,  $|z| > 1$  for the first term on the right side, and  $|z| < 1$  for the second term. Clearly there is no region of  $z$  for which  $\sum_{k=-\infty}^{\infty} z^{-k}$  is convergent.

(ii) Since  $x(n)$  is a stationary process with  $m_x \neq 0$ , we can separate it into two parts

$$x(n) = m_x + y(n)$$

In the above equation  $y(n)$  is a stationary process with  $m_y = 0$ . Taking a Fourier transform from the above equation we have

$$X(e^{j\omega}) = m_x\delta(\omega) + Y(e^{j\omega})$$

$$y(e^{j\omega}) = \sum_{n=-\infty}^{\infty} y(n)e^{-j\omega n}$$

In the vicinity of  $\omega = 0$ ,  $Y(e^{j\omega})$  becomes

$$\lim_{\omega \rightarrow 0} Y(e^{j\omega}) = \sum_{n=-\infty}^{\infty} y(n)$$

Since  $m_y = 0$ , we can expect that the above equation would also be zero., and thus in vicinity of  $\omega = 0$ , we have

$$X(e^{j\omega}) = m_x\delta(\omega)$$

(iii) As in previous part

$$x(n) = m_x + y(n)$$

$y(n)$  is a stationary process with  $m_y = 0$ . So we have

$$\phi_{xx}(k) = m_x^2 + \phi_{yy}(k)$$

$$\Phi_{xx}(e^{j\omega}) = m_x^2\delta(\omega) + \Phi_{yy}(z)$$

$$\Phi_{yy}(z) = \sum_{k=-\infty}^{\infty} \phi_{yy}(k)e^{-j\omega k}$$

In vicinity of  $\omega = 0$  we have

$$\begin{aligned} \Phi_{yy}(z) &= \sum_{k=-\infty}^{\infty} \phi_{yy}(k) \\ &= \sum_{k=-\infty}^{\infty} E[y(n)y^*(n-k)] \\ &= E \left[ y(n) \sum_{k=-\infty}^{\infty} y^*(n-k) \right] = 0 \end{aligned}$$

Accordingly,

$$\Phi_{xx}(e^{j\omega}) = m_x^2\delta(\omega)$$

6. Solution to this problem follows the same line of derivations as Problem 2.5, with  $m_x$  replaced by  $Ae^{j\omega_0 n}$ .
7. Starting from (2.54), we arrived at (2.55) as follows

$$\begin{aligned}
 \Phi_{xx}(z) &= \sum_{k=-\infty}^{\infty} \phi_{xx}(k)z^{-k} = \left( \sum_{k=-\infty}^{\infty} \phi_{xx}^*(k)(z^*)^{-k} \right)^* \\
 &= \left( \sum_{k=-\infty}^{\infty} \phi_{xx}(-k)\left(\frac{1}{z^*}\right)^k \right)^* \quad (\text{from (2.48)}) \\
 &= \left( \sum_{k=-\infty}^{\infty} \phi_{xx}(k)\left(\frac{1}{z^*}\right)^{-k} \right)^* \quad (k \rightarrow -k) \\
 &= \left( \Phi_{xx}\left(\frac{1}{z^*}\right) \right)^* \\
 &= \Phi_{xx}^*\left(\frac{1}{z^*}\right)
 \end{aligned}$$

Equation (2.56) is also proved in the same way.

8. (i) From (2.57)

$$\Phi_{vv}(z) = H^*\left(\frac{1}{z^*}\right)\Phi_{vv}(z) = \sigma_v^2 \times \left(\frac{1}{1-az^*}\right)^* = \sigma_v^2 \times \frac{1}{1-a^*z}$$

From (2.80),

$$\Phi_{uu}(z) = H(z)H^*\left(\frac{1}{z^*}\right)\Phi_{vv}(z) = \frac{\sigma_v^2}{(1-az^{-1})(1-a^*z)}$$

- (ii) For  $|a| < 1$ ,

$$\frac{1}{1-a^*z} = \sum_{k=0}^{\infty} (a^*)^k a^k = \sum_{k=-\infty}^0 (a^*)^{-k} z^{-k}$$

Since  $\phi_{vu}(k)$  is the inverse z-transform of  $\Phi_{vu}(z)$  and  $\phi_{vv}(z) = \sum_{k=-\infty}^{\infty} \phi_{vu}(k)z^{-k}$ , it follows that

$$\phi_{vu}(k) = \begin{cases} 0 & k > 0 \\ \sigma_v^2 (a^*)^{-k}, & k \leq 0 \end{cases}$$

By method of partial fraction,

$$\begin{aligned}
 \Phi_{uu}(z) &= \frac{\sigma_v^2}{(1-a^*z)(1-az^{-1})} = \frac{-(\sigma_v^2/a^*)z}{(z-1/a^*)(z-a)} \\
 &= \frac{A}{z-1/a^*} + \frac{B}{z-a}
 \end{aligned}$$

Where

$$A = \left[ -\frac{\sigma_v^2}{a^*} \frac{z}{z-a} \right]_{z=1/a^*} = -\frac{\sigma_v^2}{a^*} \frac{1}{1-|a|^2}$$

$$B = \left[ -\frac{\sigma_v^2}{a^*} \frac{z}{z-1/a^*} \right]_{z=a} = \frac{\sigma_v^2 a}{1-|a|^2}$$

The first term on the right hand side corresponds to a left sided sequence,

$$\begin{aligned} \frac{A}{z-1/a^*} &= -\frac{Aa^*}{1-a^*z} = \frac{\sigma_v^2}{1-|a|^2} \frac{1}{1-a^*z} \\ &= \frac{\sigma_v^2}{1-|a|^2} \sum_{k=0}^{\infty} (a^*)^k z^k = \frac{\sigma_v^2}{1-|a|^2} \sum_{k=-\infty}^0 (1/a^*)^k z^{-k} \end{aligned}$$

and the second term to a right sided sequence

$$\begin{aligned} \frac{B}{z-a} &= \frac{Bz^{-1}}{1-az^{-1}} = Bz^{-1} \sum_{k=0}^{\infty} a^k z^{-k} \\ &= \frac{\sigma_v^2}{1-|a|^2} \sum_{k=1}^{\infty} a^{k-1} z^{-k} \end{aligned}$$

Using the above results, and since  $\Phi_{uu}(z) = \sum_{k=-\infty}^{\infty} \phi_{uu} z^{-k}$ , we get

$$\phi_{uu}(k) = \begin{cases} \frac{\sigma_v^2}{1-|a|^2} a^{k-1} & k > 0 \\ \frac{\sigma_v^2}{1-|a|^2} (a^*)^{-k} & k \leq 0 \end{cases}$$

(iii)

$$\sigma_u^2 = \phi_{uu}(0) = \frac{\sigma_v^2}{1-|a|^2}$$

9. (i) When  $a \neq b$ ,

$$\Phi_{vu}(z) = H^*\left(\frac{1}{z^*}\right) \Phi_{vv}(z) = \frac{\sigma_v^2}{(1-a^*z)(1-b^*z)}$$

$$\Phi_{uu}(z) = H(z)H^*\left(\frac{1}{z^*}\right) \Phi_{vv}(z) = \frac{\sigma_v^2}{(1-az^{-1})(1-bz^{-1})(1-a^*z)(1-b^*z)}$$

When  $a = b$ ,

$$\Phi_{vu}(z) = H^*\left(\frac{1}{z^*}\right) \Phi_{vv}(z) = \frac{\sigma_v^2}{(1-a^*z)^2}$$

$$\Phi_{uu}(z) = H(z)H^*\left(\frac{1}{z^*}\right) \Phi_{vv}(z) = \frac{\sigma_v^2}{(1-az^{-1})^2(1-a^*z)^2}$$

(ii) When  $a \neq b$

$$\Phi_v u(z) = \frac{\sigma_v^2}{a^* - b^*} \left[ \frac{a^*}{1 - a^* z} - \frac{b^*}{1 - b^* z} \right]$$

Thus, we have

$$\phi_{vu}(k) = \begin{cases} 0 & k > 0 \\ \frac{\sigma_v^2}{a^* - b^*} [(a^*)^{-k+1} - (b^*)^{-k+1}] & k \leq 0 \end{cases}$$

Similarly,

$$\Phi_{uu}(z) = \frac{A}{(z - a)} + \frac{B}{(z - b)} + \frac{C}{(z - 1/a^*)} + \frac{D}{(z - 1/b^*)}$$

Where

$$\begin{aligned} A &= \left[ \frac{\sigma_v^2 z^2}{a^* b^* (z - b)(z - 1/a^*)(z - 1/b^*)} \right]_{z=a} = \frac{\sigma_v^2 a^2}{(a - b)(1 - |a|^2)(1 - ab^*)} \\ B &= \left[ \frac{\sigma_v^2 z^2}{a^* b^* (z - a)(z - 1/a^*)(z - 1/b^*)} \right]_{z=b} = \frac{-\sigma_v^2 a^2}{(a - b)(1 - |b|^2)(1 - ba^*)} \\ C &= \left[ \frac{\sigma_v^2 z^2}{a^* b^* (z - a)(z - b)(z - 1/b^*)} \right]_{z=1/a^*} = \frac{-\sigma_v^2}{(a^* - b^*)(1 - |a|^2)(1 - ba^*)} \\ D &= \left[ \frac{\sigma_v^2 z^2}{a^* b^* (z - a)(z - b)(z - 1/a^*)} \right]_{z=1/b^*} = \frac{\sigma_v^2 a^2}{(a^* - b^*)(1 - |b|^2)(1 - ab^*)} \end{aligned}$$

Hence,

$$\begin{aligned} \Phi_{uu}(z) &= \frac{Az^{-1}}{(1 - az^{-1})} + \frac{Bz^{-1}}{(1 - bz^{-1})} - \frac{Ca^*}{(1 - a^*z)} - \frac{Da^*}{(1 - a^*z)} \\ &= \sum_{k=1}^{\infty} Aa^{k-1}z^{-k} + \sum_{k=1}^{\infty} Ba^{k-1}z^{-k} - \sum_{k=-\infty}^0 C(a^*)^{-k+1}z^{-k} - \sum_{k=-\infty}^0 D(b^*)^{-k+1}z^{-k} \end{aligned}$$

and

$$\phi_{vu}(k) = \begin{cases} Aa^{k-1} + Bb^{k-1} & k > 0 \\ -C(a^*)^{-k+1} - D(b^*)^{-k+1} & k \leq 0 \end{cases}$$

When  $a = b$ ,

$$\phi_{vu}(k) = \frac{1}{2\pi j} \oint_C \Phi_{vu}(z) z^{k-1} dz = \frac{1}{2\pi j} \oint_C \frac{\sigma_v^2 z^{k-1}}{(1 - a^*z)^2} dz = \frac{1}{2\pi j} \oint_C \frac{\sigma_v^2 z^{k-1}}{(a^*)^2 (z - 1/a^*)^2} dz$$

Where  $C$  is a contour in  $|a| < |z| < |a|^{-1}$ . For  $k \geq 1$ , there is no poles inside  $C$  implies that  $\phi_{vu}(k) = 0$ . For  $k < 1$ , substituting  $z = 1/p$  and noting that  $p = a^*$  is the only pole in  $C$ ,

$$\phi_{vu}(k) = \frac{1}{2\pi j} \oint_C \Phi_{vu}(1/p) p^{-k-1} dp = \frac{1}{2\pi j} \oint_C \frac{\sigma_v^2 p^{-k+1}}{(p - a^*)^2} dp$$

$$= \text{Residue} \left[ \frac{\sigma_v^2 p^{-k+1}}{(p-a^*)^2} \right]_{p=a^*} = \left[ \frac{d}{dp} \sigma_v^2 p^{-k+1} \right]_p = a^* = \sigma_v^2 (1-k)(a^*)^{-k}$$

Hence,

$$\phi_{vu}(k) = \begin{cases} 0 & k > 0 \\ \sigma_v^2 (1-k)(a^*)^{-k} & k \leq 0 \end{cases}$$

Similarly, applying the residue method to find inverse z-transform of  $\Phi_{uu}(z)$ ,

$$\phi_{uu}(k) = \begin{cases} \frac{\sigma_v^2}{(1-|a|^2)^3} [(1-|a|^2)(1+k) + 2|a|^2] a^k & k \geq -1 \\ \frac{\sigma_v^2}{(1-|a|^2)^3} [(1-|a|^2)(1-k) + 2|a|^2] (a^*)^{-k} & k < -1 \end{cases}$$

(iii)

$$\sigma_u^2 = \phi_{uu}(0)$$

10. (i) Using (2.75),

$$\begin{aligned} \Phi_{vu}(z) &= H^*(1/z^*) \Phi_{vv}(z) = \left( \sum_{n=0}^{N-1} h(n)(z^*)^n \right)^* \sigma_v^2 \\ \sigma_v^2 \sum_{n=0}^{N-1} h^*(n) z^n &= \sigma_v^2 \sum_{n=-(N-1)}^0 h^*(-n) z^{-n} \end{aligned}$$

Using (2.80),

$$\begin{aligned} \Phi_{uu}(z) H(z) H^*(1/z^*) \Phi_{vv}(z) &= \sigma_v^2 \sum_{n=0}^{N-1} h(n) z^{-n} \sum_{m=0}^{N-1} h^*(m) z^m \\ &= \sigma_v^2 \sum_{n=0}^{N-1} \sum_{m=0}^{N-1} h(n) h^*(m) z^{-(n-m)} \end{aligned}$$

With  $n - m = k$ , we obtain

$$\Phi_{uu}(z) = \sigma_v^2 \sum_{k=-(N-1)}^{N-1} \alpha_h(k) z^{-k},$$

$$\text{where } \alpha_h(k) = \sum_{m=\max(0, -k)}^{\min(N-1, N-1-k)} h(m+k) h^*(m).$$

(ii) From the result of Part (a), we immediately obtain

$$\phi_{vu}(k) = \begin{cases} \sigma_v^2 h^*(-k) & -(N-1) \leq k \leq 0 \\ 0 & \text{otherwise} \end{cases}$$

and

$$\begin{aligned} \phi_{uu}(k) &= \begin{cases} \sigma_v^2 \alpha_h(k) & -(N-1) \leq k \leq N-1 \\ 0 & \text{otherwise} \end{cases} \\ &= \sigma_v^2 \alpha_h(k) \quad (\text{since } \alpha_h(k) = 0 \text{ for } k \leq -N \text{ and } k \geq N) \end{aligned}$$

11. From (2.65),

$$E[|x_N(e^{j\omega})|^2] = \sum_{n=-N}^N \sum_{m=-N}^N E[x(n)x^*(m)]e^{-j\omega(n-m)} = \sum_{n=-N}^N \sum_{m=-N}^N \phi_{xx}(n-m)e^{j\omega(n-m)}$$

Next, we note that  $k = n - m$  can take values in the range  $-2N$  to  $2N$  and for any  $k = n - m$ , there are  $2N + 1 - |k|$  similar terms added together. Thus we obtain

$$E[|x_N(e^{j\omega})|^2] = \sum_{k=-2N}^{2N} (2N + 1 - |k|)\phi_{xx}(k)e^{-j\omega k}$$

Dividing both sides of the result by  $2N + 1$ , gives (2.66).

12. From (2.75),  $\phi_{xy}(z) = H^*(1/z^*)\Phi_{xx}(z)$ . Using (2.55) and (2.56), we get

$$\Phi_{yx}^*(1/z^*) = H^*(1/z^*)\Phi_{xx}(z)$$

Hence,  $\Phi_{yx}(z) = H(z)\Phi_{xx}^*(1/z^*) = H(z)\Phi_{xx}(z)$  From (2.90),  $\Phi_{dy}(z) = H^*(1/z^*)\Phi_{dx}(z)$ . Again using (2.56), we get

$$\Phi_{yd}^*(1/z^*) = H^*(1/z^*)\Phi_{xd}^*(1/z^*)$$

Hence,  $\Phi_{yd}(z) = H(z)\Phi_{xd}(z)$ .

13. Using  $\star$  to denote convolution,

- (i)  $\phi_{yx}(n) = h(n) \star \phi_{xx}(n)$ ,
- (ii)  $\phi_{xy}(n) = h^*(-n) \star \phi_{xx}(n)$ ,
- (iii)  $\phi_{yd}(n) = h(n) \star \phi_{xd}(n)$ ,
- (iv)  $\phi_{dy}(n) = h^*(-n) \star \phi_{dx}(n)$

14. Let  $y(n) = y_1(n) + y_2(n)$ , where  $y_1(n)$  and  $y_2(n)$  are the outputs of  $H(z)$  and  $G(z)$ , respectively.

(i) Since  $u(n)$  and  $v(n)$  are uncorrelated,

$$\phi_{uy}(n) = \phi_{uy_1}(n) + \phi_{uy_2}(n) = \phi_{uy_1}(n)$$

Hence,

$$\Phi_{uy}(z) = \Phi_{uy_1}(z) = H^*(1/z^*)\Phi_{uu}(z) = \sigma_u^2 H^*(1/z^*).$$

(ii) Similar to Part (b),  $\Phi_{vy}(z) = \sigma_v^2 G^*(1/z^*)$ .

(iii) Noting that  $y_1(n)$  and  $y_2(n)$  are originating from uncorrelated source,  $u(n)$  and  $v(n)$ , respectively, we obtain  $\Phi_{yy}(z) = \Phi_{y_1y_1}(z) + \Phi_{y_2y_2}(z) = \sigma_u^2 H(z)H^*(1/z^*) + \sigma_v^2 G(z)G^*(1/z^*)$ .

15. (i) Using  $\Phi_{xx}(z) = H(z)H^*(1/z^*)\Phi_{vv}(z)$ , with  $H(z) = \frac{1}{1-0.5z^{-1}}$  and  $\Phi_{vv}(z) = 1$ , we obtain

$$\Phi_{xx}(z) = \frac{1}{1-0.5z^{-1}} \left[ \frac{1}{1-0.5(1/z^*)^{-1}} \right]^* = \frac{1}{(1-0.5z^{-1})(1-0.5z)}$$

- (ii) Since  $\Phi_{yy}(z) = G(z)G^*(1/z^*)\Phi_{zz}(z)$ , where  $G(z) = 1-2z^{-1}$ , we obtain

$$\begin{aligned} \Phi_{yy}(z) &= \frac{1-2z^{-1}}{1-0.5z^{-1}} \times \left[ \frac{1-2(1/z^*)^{-1}}{1-0.5(1/z^*)^{-1}} \right]^* \Phi_{vv}(z) = \frac{1-2z^{-1}}{1-0.5z^{-1}} \times \frac{1-2z}{1-0.5z} \\ &= \frac{1-2(z+z^{-1})+4}{1-0.5(z+z^{-1})+1/4} = 4 \end{aligned}$$

- (iii) Using  $\Phi_{vy}(z) = H^*(1/z^*)G^*(1/z^*)\Phi_{vv}(z)$ ,

$$\Phi_{vy}(z) = \left[ \frac{1-2(1/z^*)^{-1}}{1-0.5(1/z^*)^{-1}} \right]^* \Phi_{vv}(z) = \frac{1-2z}{1-0.5z}.$$

16. (i) Since  $x(n) = \sum_k h(k)v(n-k)$  and  $y(n) = \sum_k g(k)v(n-k)$ ,

$$\begin{aligned} \phi_{xy}(m) &= E[x(n)y^*(n-m)] = E\left[\sum_l \sum_k h(k)g^*(l)v(n-k)v^*(n-m-l)\right] \\ &= \sum_l \sum_k h(k)g^*(l)E[v(n-k)v^*(n-m-l)] = \sum_l \sum_k h(k)g^*(l)\delta(-k+l+m). \end{aligned}$$

But  $\delta(-k+l+m) = 1$  for  $k = l+m$  and zero elsewhere. Using this in the above result, we obtain  $\phi_{xy}(m) = \sum_l h(l+m)g^*(l)$ .

- (ii) Since  $\Phi_{xy}(z)$  is the z-transform of  $\phi_{xy}(m)$ ,

$$\begin{aligned} \Phi_{xy}(z) &= \sum_m \phi_{xy}(m)z^{-m} = \sum_m \sum_l h(l+m)g^*(l)z^{-m} \\ &= \sum_m \sum_l h(l+m)z^{-(m+l)}g^*(l)z^l = \sum_l g^*(l)z^l \sum_m h(l+m)z^{-(m+l)} \\ &= G^*(1/z^*)H(z) = H(z)G^*(1/z^*). \end{aligned}$$

17. (i) Since  $u(n) = x(n) + y(n)$ , we have

$$\begin{aligned} \phi_{uu}(k) &= E[(x(n) + y(n))(x^*(n+k) + y^*(n+k))] \\ &= E[x(n)x^*(n+k)] + E[y(n)y^*(n+k)] + E[x(n)y^*(n+k)] + E[y(n)x^*(n+k)] \\ &= \phi_{xx}(k) + \phi_{yy}(k) + \phi_{xy}(k) + \phi_{yx}(k) \end{aligned}$$

Hence,

$$\Phi_{uu}(z) = \Phi_{xx}(z) + \Phi_{yy}(z) + \Phi_{xy}(z) + \Phi_{yx}(z) = \Phi_{xx}(z) + \Phi_{yy}(z) + \Phi_{xy}(z) + \Phi_{xy}^*(1/z^*)$$

(ii) Since  $u(n)$  is the output of a system with input  $v(n)$  and transfer function  $H(z) + G(z)$ ,

$$\begin{aligned}\Phi_{uu}(z) &= (H(z) + G(z))(H^*(1/z^*) + G^*(1/z^*))\Phi_{vv}(z) \\ &= H(z)H^*(1/z^*)\Phi_{vv}(z) + G(z)G^*(1/z^*)\Phi_{vv}(z) + H(z)G^*(1/z^*)\Phi_{vv}(z) + H^*(1/z^*)G(z)\Phi_{vv}(z)\end{aligned}$$

Since  $v(n)$  is a zero-mean unit-variance white noise process,

$$\Phi_{vv}(z) = 1$$

and we have

$$\Phi_{uu}(z) = \Phi_{xx}(z) + \Phi_{yy}(z) + \Phi_{xy}(z) + \Phi_{yx}(z) = \Phi_{xx}(z) + \Phi_{yy}(z) + \Phi_{xy}(z) + \Phi_{xy}^*(1/z^*)$$
