

## Chapter 1

1.1

$$f(t) = 5 \sin(10t - 2.5) \quad (1)$$

Eq. (1) can be rewritten as

$$\begin{aligned} f(t) &= 5 [\sin \omega t \cos 2.5 - \cos \omega t \sin 2.5] \\ &= C_1 \sin \omega t + C_2 \cos \omega t \end{aligned} \quad (2)$$

$$\text{where } C_1 = 5 \cos 2.5 = 5 (-0.8011) = -4.0057$$

$$\text{and } C_2 = -5 \sin 2.5 = -5 (0.5985) = -2.9925$$

$f(t)$  is expressed as a sum of sine and cosine functions with  $C_1 = -4.0057$  and  $C_2 = -2.9925$ .

1.2

(a)

$$x_1(t) = 5 \sin 20t, \quad x_2(t) = 8 \cos (20t + \frac{\pi}{3}) \quad (1)$$

$$x(t) = x_1(t) + x_2(t) = 5 \sin 20t + 8 \cos (20t + \frac{\pi}{3}) \quad (2)$$

$x(t)$  is a cosine function with a phase angle.

Eq. (2) can be rewritten as

$$x(t) = 5 \sin 20t + 8 \left( \cos 20t \cdot \cos \frac{\pi}{3} - \sin 20t \cdot \sin \frac{\pi}{3} \right)$$

$$= \cos 20t \left( 8 \cos \frac{\pi}{3} \right) - \sin 20t \left( -5 + 8 \sin \frac{\pi}{3} \right) \quad (3)$$

or

$$x(t) = A \cos (20t + \phi)$$

$$= A \cos 20t \cdot \cos \phi - A \sin 20t \cdot \sin \phi$$

By equating Eqs. (3) and (4), we obtain

$$A \cos \phi = 8 \cos \frac{\pi}{3} = 8(0.5) = 4.0$$

$$A \sin \phi = -5 + 8 \sin \frac{\pi}{3} = -5 + 8(0.866) = 1.9282$$

$$\begin{aligned} \text{Thus } A &= \sqrt{(A \cos \phi)^2 + (A \sin \phi)^2} = \sqrt{4.0^2 + 1.9282^2} \\ &= \sqrt{16.0 + 3.7179} = \sqrt{19.7179} = 4.4405 \end{aligned}$$

$$\begin{aligned} \text{and } \phi &= \tan^{-1} \left( \frac{A \sin \phi}{A \cos \phi} \right) = \tan^{-1} \left( \frac{1.9282}{4.0} \right) = \tan^{-1}(0.48205) \\ &= 25.7364^\circ \text{ or } 0.4492 \text{ rad} \end{aligned}$$

$$\therefore x(t) = 4.4405 \cos (20t + 0.4492)$$

$$= 4.4405 \cos (20t + 25.7364^\circ) \quad (5)$$

Problem 1.2 p.1/2

(b)  $x(t)$  as a sine function with a phase angle.

Eqs. (2) can be rewritten as

$$\begin{aligned} x(t) &= 5 \sin 20t + 8 (\cos 20t \cdot \cos \frac{\pi}{3} - \sin 20t \cdot \sin \frac{\pi}{3}) \\ &= \sin 20t (5 - 8 \sin \frac{\pi}{3}) + \cos 20t (8 \cos \frac{\pi}{3}) \end{aligned} \quad (6)$$

$$x(t) = A \sin 20t \cos \phi + A \cos 20t \sin \phi \quad (7)$$

We obtain, by comparing Eqs. (6) and (7),

$$A \cos \phi = 5 - 8 \sin \frac{\pi}{3} = -1.9282 \quad (8)$$

$$A \sin \phi = 8 \cos \frac{\pi}{3} = 4.0 \quad (9)$$

so that

$$\begin{aligned} A &= \sqrt{(A \cos \phi)^2 + (A \sin \phi)^2} \\ &= \sqrt{(-1.9282)^2 + (4.0)^2} = 4.4405 \end{aligned}$$

and

$$\phi = \tan^{-1} \left( \frac{A \sin \phi}{A \cos \phi} \right) = \tan^{-1} \left( \frac{4.0}{-1.9282} \right) = \tan^{-1} (-2.0745)$$

$$= -64.2636^\circ = -1.1216 \text{ rad}$$

$$\text{or } 180^\circ - 64.2636^\circ$$

$$= 115.7372^\circ$$

Since cosine is negative and sine is positive,

$$\phi = 115.7372^\circ \text{ or } 2.0200 \text{ rad.}$$

$$\therefore x(t) = 4.4405 \sin(20t + 2.0200)$$

$$\text{or } 4.4405 \sin(20t + 115.7372^\circ)$$

Problem 1.2 p.2/2

1.3

$$x_1(t) = 6 \sin 30t$$

$$x_2(t) = 4 \cos(30t + \frac{\pi}{4})$$

$$x(t) = x_1(t) - x_2(t) = 6 \sin 30t - 4 \cos(30t + \frac{\pi}{4}) \quad (1)$$

(a)  $x(t)$  as a sine function with a phase angle.

Eq. (1) can be rewritten as

$$x(t) = 6 \sin 30t - 4 (\cos 30t \cdot \cos \frac{\pi}{4} - \sin 30t \cdot \sin \frac{\pi}{4}) \quad (2)$$

$$= \sin 30t (6 + 4 \sin \frac{\pi}{4}) + \cos 30t (-4 \cos \frac{\pi}{4}) \quad (3)$$

By expressing Eq. (3) as  
 $x(t) = A \sin(30t + \phi)$

$$\Rightarrow A \sin 30t \cdot \cos \phi + A \cos 30t \cdot \sin \phi \quad (4)$$

Eqs. (3) and (4) yield:

$$A \cos \phi = 6 + 4 \sin \frac{\pi}{4} = 6 + 4(0.7071) = 8.8284$$

$$A \sin \phi = -4 \cos \frac{\pi}{4} = -4(0.7071) = -2.8284$$

where

$$\begin{aligned} A &= \sqrt{(A \cos \phi)^2 + (A \sin \phi)^2} = \sqrt{(8.8284)^2 + (-2.8284)^2} \\ &= \sqrt{77.9406 + 7.9998} = \sqrt{85.9404} = 9.2704 \end{aligned}$$

$$\begin{aligned} \text{and } \phi &= \tan^{-1} \left( \frac{A \sin \phi}{A \cos \phi} \right) = \tan^{-1} \left( \frac{-2.8284}{8.8284} \right) = \tan^{-1}(-0.3204) \\ &= -17.7642^\circ = -0.3100 \text{ rad} \end{aligned}$$

$$\therefore x(t) = 9.2704 \sin(30t - 0.31) = 9.2704 \sin(30t - 17.7642^\circ) \quad (5)$$

Problem 1.3 p.1/2

(b)  $x(t)$  as a cosine function with a phase angle:

Eq. (2) can be rewritten as

$$x(t) = \cos 30t \left( -4 \cos \frac{\pi}{4} \right) - \sin 30t \left( -6 - 4 \sin \frac{\pi}{4} \right) \quad (6)$$

By expressing Eq. (6) as

$$x(t) = A \cos(30t - \phi) = A \cos 30t \cdot \cos \phi - A \sin 30t \cdot \sin \phi \quad (7)$$

By equating Eqs. (6) and (7), we find

$$A \cos \phi = -4 \cos \frac{\pi}{4} = -2.8284 \quad (8)$$

$$A \sin \phi = -6 - 4 \sin \frac{\pi}{4} = -8.8284 \quad (9)$$

so that

$$\begin{aligned} A &= \sqrt{(A \cos \phi)^2 + (A \sin \phi)^2} = \sqrt{(-2.8284)^2 + (-8.8284)^2} \\ &= \sqrt{7.9998 + 77.9406} = \sqrt{85.9404} = 9.2704 \end{aligned}$$

and

$$\begin{aligned} \phi &= \tan^{-1} \left( \frac{A \sin \phi}{A \cos \phi} \right) = \tan^{-1} \left( \frac{-8.8284}{-2.8284} \right) = \tan^{-1}(3.1213) \\ &= \tan^{-1}(178.8369^\circ) = 89.6796^\circ \text{ or } 180^\circ + 89.6796^\circ \\ &\quad = 1.5652 \text{ rad or } 4.7068 \text{ rad} \end{aligned}$$

Since both  $\sin \phi$  and  $\cos \phi$  are negative, the correct value of  $\phi$  is  $4.7068 \text{ rad}$  or  $269.6796^\circ$

$$\begin{aligned} \therefore x(t) &= 9.2704 \cos(30t - 4.7068) \\ &= 9.2704 \cos(30t - 269.6796^\circ) \quad (10) \end{aligned}$$

1.4

$$x_1(t) = 5 \cos \omega t, \quad x_2(t) = 10 \cos(\omega t + 1) \quad (1)$$

(a) Using trigonometric relations:

$$x(t) = x_1(t) + x_2(t) = 5 \cos \omega t + 10 \cos(\omega t + 1) \quad (2)$$

$$= 5 \cos \omega t + 10 (\cos \omega t \cdot \cos 1 - \sin \omega t \cdot \sin 1)$$

$$= \cos \omega t (5 + 10 \cos 1) - \sin \omega t (10 \sin 1) \quad (3)$$

By expressing Eq. (3) as

$$\begin{aligned} x(t) &= A \cos(\omega t + \phi) = A(\cos \omega t \cdot \cos \phi - \sin \omega t \cdot \sin \phi) \\ &= \cos \omega t (A \cos \phi) - \sin \omega t (A \sin \phi) \end{aligned} \quad (4)$$

we obtain, by comparing Eqs. (3) and (4),

$$A \cos \phi = 5 + 10 \cos 1$$

$$A \sin \phi = +10 \sin 1$$

$$\begin{aligned} A &= \sqrt{(A \cos \phi)^2 + (A \sin \phi)^2} = \sqrt{(5 + 10 \cos 1)^2 + (10 \sin 1)^2} \\ &= \sqrt{[5 + 10 \cdot 0.5403]^2 + [10 \cdot 0.8417]^2} \\ &= (108.2224 + 70.8459)^{\frac{1}{2}} = 13.3816 \end{aligned}$$

and

$$\phi = \tan^{-1} \left( \frac{10 \sin 1}{5 + 10 \cos 1} \right) = \tan^{-1} \left( \frac{8.417}{10.403} \right)$$

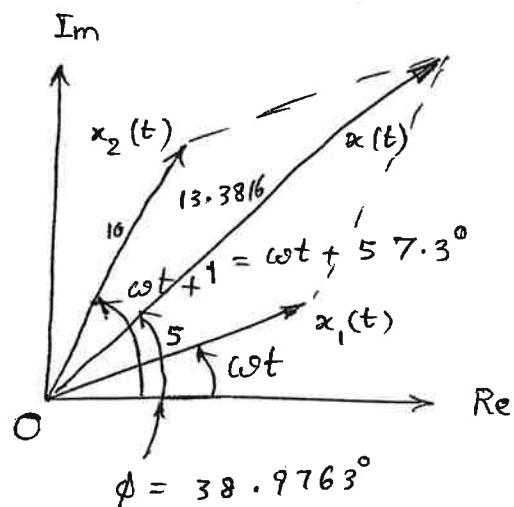

$$= \tan^{-1}(0.8091) = 0.6803 \text{ rad} = 38.9763^\circ$$

$$\therefore x(t) = x_1(t) + x_2(t) = 13.3816 \cos(\omega t + 0.6803)$$

Problem 1.4 p.1/2

(b) Using vectors:

For an arbitrary value of  $\omega t$ , the harmonic motions  $x_1(t)$  and  $x_2(t)$  can be denoted graphically as shown in the following figure.

(c) Using complex number representation

Given  $x_1(t)$  and  $x_2(t)$  can be expressed as complex numbers:

$$x_1(t) = \operatorname{Re} [A_1 e^{i\omega t}] = \operatorname{Re} [5 e^{i\omega t}]$$

$$x_2(t) = \operatorname{Re} [A_2 e^{i(\omega t + 1)}] = \operatorname{Re} [10 e^{i(\omega t + 1)}]$$

$$\text{where } A_1 = \sqrt{(5 + 10 \cos 1)^2 + 0^2} = 10.403$$

$$\text{and } A_2 = \sqrt{(0 + 10 \sin 1)^2} = 8.417$$

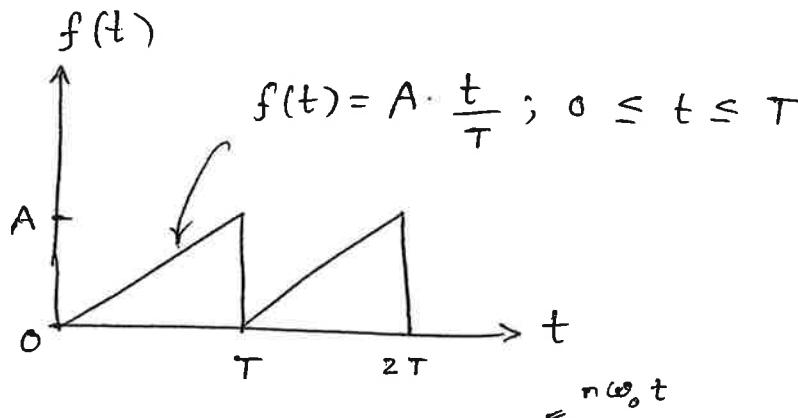

$$\text{Thus } x(t) = \operatorname{Re} [A e^{i(\omega t + \phi)}] = x_1 + x_2$$

$$\text{with } A = \sqrt{A_1^2 + A_2^2} = 13.3816$$

$$\text{and } \phi = \tan^{-1} \left( \frac{A_2}{A_1} \right) = 38.9763^\circ \text{ or } 0.6803 \text{ rad}$$

Problem 1.4 p.2/2

1.6

$$\begin{cases} T = \frac{2\pi}{\omega_0} \\ \omega_0 = \frac{2\pi}{T} \end{cases}$$

$$a_n = \frac{2}{T} \int_0^T A \cdot \frac{t}{T} \cos\left(\frac{2\pi n t}{T}\right) dt$$

$$= \frac{2A}{T^2} \cdot \int_0^t t \cdot \cos \frac{2\pi n t}{T} dt$$

$$= \frac{2A}{T^2} \left[ \frac{T^2}{(2\pi n)^2} \cdot \cos \frac{2\pi n t}{T} \cdot t + \frac{t \cdot T}{2\pi n} \cdot \sin \frac{2\pi n t}{T} \cdot t \right]_0^T$$

$$= \frac{2A}{T^2} \cdot \left[ \frac{T^2}{4\pi^2 n^2} \cdot \left( \cos \frac{2\pi n \cdot T}{T} - 1 \right) + \frac{T^2}{2\pi n} \cdot \left( \sin \frac{2\pi n \cdot T}{T} \right) \right]$$

$$= \frac{A}{2\pi^2 n^2} (\cos 2\pi n - 1) + \frac{A}{\pi n} \underbrace{\left( \sin 2\pi n \right)}_0$$

$$b_n = \frac{2}{T} \int_0^T A \cdot \frac{t}{T} \sin \frac{2\pi n t}{T} dt$$

$$a_0 = A, \quad a_n = 0; \quad n = 1, 2, 3, \dots; \quad b_n = -\frac{A}{n\pi}; \quad n = 1, 2, 3, \dots$$

$$\therefore f(t) = A \left( \frac{1}{2} - \frac{1}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{2\pi n t}{T} \right)$$

1.7

$$x(t) = \begin{cases} A \sin \frac{2\pi t}{\tau}, & 0 \leq t \leq \frac{\tau}{2} \\ 0, & \frac{\tau}{2} \leq t \leq \tau \end{cases}$$

$$a_0 = \frac{2}{\tau} \int_0^{\tau} x(t) dt = \frac{2A}{\tau} \int_0^{\tau/2} \sin \frac{2\pi t}{\tau} dt = \frac{2A}{\tau} \left( -\frac{\tau}{2\pi} \cos \frac{2\pi t}{\tau} \right) \Big|_0^{\tau/2} = \frac{2A}{\pi}$$

$$a_n = \frac{2}{\tau} \int_0^{\tau} x(t) \cos n\omega t dt = \frac{2A}{\tau} \int_0^{\tau/2} \sin \frac{2\pi t}{\tau} \cdot \cos n\omega t dt \quad \dots \text{--- (E1)}$$

Using the relation  $\sin m\omega t \cdot \cos n\omega t = \frac{\sin(m+n)\omega t + \sin(m-n)\omega t}{2}$ ,

Eg. (E1) can be rewritten as

$$a_n = \frac{A}{\tau} \int_0^{\pi/\omega} [\sin(1+n)\omega t + \sin(1-n)\omega t] dt$$

$$\text{when } n=1, \quad a_1 = \frac{A}{\tau} \int_0^{\pi/\omega} \sin 2\omega t dt = 0$$

$$\text{when } n=2, 3, 4, \dots, \quad a_n = \frac{A}{\tau} \left[ -\frac{\cos(1+n)\omega t}{(1+n)\omega} - \frac{\cos(1-n)\omega t}{(1-n)\omega} \right] \Big|_0^{\pi/\omega}$$

$$= \frac{A}{2\pi} \left[ \frac{1 - \cos(1+n)\pi}{1+n} + \frac{1 - \cos(1-n)\pi}{1-n} \right]$$

$$= \begin{cases} 0 & \text{if } n \text{ is odd} \\ -\frac{2A}{(n-1)(n+1)\pi} & \text{if } n \text{ is even} \end{cases}$$

Similarly

$$b_n = \frac{2}{\tau} \int_0^{\tau} x(t) \sin n\omega t dt = \frac{2A}{\tau} \int_0^{\tau/2} \sin \frac{2\pi t}{\tau} \cos n\omega t dt$$

$$= \frac{A}{\tau} \int_0^{\tau/2} [\cos(1-n)\omega t - \cos(1+n)\omega t] dt$$

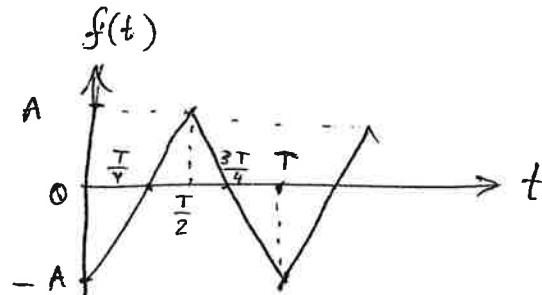

$$\text{when } n=1, \quad b_1 = \frac{A}{\tau} \int_0^{\pi/\omega} (\sin t - \cos 2\omega t) dt = \frac{A}{2}$$

$$\text{when } n=2, 3, 4, \dots, \quad b_n = \frac{A}{\tau} \left[ \frac{\sin(1-n)\omega t}{(1-n)\omega} - \frac{\sin(1+n)\omega t}{(1+n)\omega} \right] \Big|_0^{\pi/\omega} = 0$$

$$\therefore x(t) = \frac{A}{\pi} + \frac{A}{2} \sin \omega t - \frac{2A}{\pi} \sum_{n=2,4,6,\dots}^{\infty} \frac{\cos n\omega t}{(n^2-1)}$$

1.9

$$f(t) = \begin{cases} \left(\frac{4A}{T}\right)t - A & ; 0 \leq t \leq \frac{T}{2} \\ A - \frac{4A}{T}(t - \frac{T}{2}) & = 3A - \frac{4At}{T}; \frac{T}{2} \leq t \leq T \end{cases}$$

$$\begin{aligned} Q_0 &= \frac{2}{T} \int_0^T F(t) \cdot dt = \frac{2}{T} \left[ \int_0^{T/2} \left\{ \left(\frac{4A}{T}\right)t - A \right\} dt \right. \\ &\quad \left. + \int_{T/2}^T \left\{ A - \frac{4A}{T}(t - \frac{T}{2}) \right\} dt \right] \\ &= \frac{2}{T} \left[ \frac{4A}{T} \cdot \left( \frac{t^2}{2} \Big|_0^{T/2} \right) - A \cdot \left( t \Big|_0^{T/2} \right) \right. \\ &\quad \left. + A \cdot \left( t \Big|_{T/2}^T \right) - \frac{4A}{T} \cdot \left( \frac{t^2}{2} \Big|_{T/2}^T \right) + \left( \frac{4AT}{2T} \right) \cdot \left( t \Big|_{T/2}^T \right) \right] \\ &= \frac{2}{T} \left[ \frac{4A}{2T} \cdot \left( \frac{T^2}{4} \right) - A \cdot \frac{T}{2} \right. \\ &\quad \left. + A \cdot \left( T - \frac{T}{2} \right) - \frac{4A}{2T} \left( T^2 - \frac{T^2}{4} \right) + 2A \left( T - \frac{T}{2} \right) \right] \\ &= \frac{2}{T} \left[ \cancel{\frac{AT}{2}} - \cancel{\frac{AT}{2}} + \cancel{\frac{AT}{2}} - \frac{2A}{T} \left( \frac{3T^2}{4} \right) + 2A \cdot \frac{T}{2} \right] \\ &= \frac{2}{T} \left[ \frac{AT}{2} - \frac{3AT}{2} + \frac{2AT}{2} \right] = 0 \end{aligned}$$

Problem 1.9 p.1/3

$$\begin{aligned}
 a_n &= \frac{2}{T} \int_0^{T/2} \left( \frac{4A}{T} \cdot t - A \right) \cos n\omega_0 t \, dt \\
 &\quad + \frac{2}{T} \int_{T/2}^T \left[ 3A - \frac{4A}{T} \cdot t \right] \cos n\omega_0 t \, dt \\
 &= \frac{2}{T} \cdot \frac{4A}{T} \cdot \int_0^{T/2} t \cdot \cos n\omega_0 t \, dt - \frac{2A}{T} \cdot \int_0^{T/2} \cos n\omega_0 t \, dt \\
 &\quad + \frac{2}{T} (3A) \cdot \int_{T/2}^T \cos n\omega_0 t \, dt \\
 &\quad - \left( \frac{2}{T} \cdot \frac{4A}{T} \right) \cdot \int_{T/2}^T t \cdot \cos n\omega_0 t \, dt \\
 &\quad - \left( \frac{8A}{T^2} \right) \\
 &= \frac{8A}{T^2} \left[ \frac{1}{n^2\omega_0^2} \cos n\omega_0 t + \frac{t}{n\omega_0} \sin n\omega_0 t \right]_0^{T/2} \\
 &\quad - \frac{2A}{T} \left[ \frac{1}{n\omega_0} \sin n\omega_0 t \right]_0^{T/2} + \frac{6A}{T} \left[ \frac{1}{n\omega_0} \sin n\omega_0 t \right]_0^{T/2} \\
 &\quad - \frac{8A}{T^2} \left[ \frac{1}{n^2\omega_0^2} \cos n\omega_0 t + \frac{t}{n\omega_0} \sin n\omega_0 t \right]_{T/2}^T \tag{A}
 \end{aligned}$$

where  $\int \cos ax \, dx = \frac{1}{a} \sin ax$

and  $\int_x^t \cos ax \, dx = \frac{1}{a^2} \cos ax + \frac{x}{a} \sin ax$

with  $a = n\omega_0$  were used.

Problem 1.9 p. 2/3

E<sub>f</sub>. (A) gives

$$\frac{8A}{T^2} \cdot \frac{1}{n^2\omega_0^2} \left[ \cos \frac{n\omega_0 T}{2} \right]$$

$$+ \frac{8A}{T^2} \cdot \frac{T}{2n\omega_0} \cdot \left[ \sin \frac{n\omega_0 T}{2} \right] - \frac{2A}{Tn\omega_0} \cdot \sin \frac{n\omega_0 T}{2} + \frac{6A}{Tn\omega_0} \cdot \sin \frac{n\omega_0 T}{2}$$

$$- \frac{8A}{T^2} \cdot \frac{1}{n^2\omega_0^2} \cos n\omega_0 T - \frac{8A}{Tn\omega_0} \cdot \sin n\omega_0 T$$

$$+ \frac{8A}{T^2 \cdot n^2\omega_0^2} \cos \frac{n\omega_0 T}{2} + \frac{4A}{Tn\omega_0} \sin \frac{n\omega_0 T}{2}$$

$$= \frac{16A}{T^2 \cdot n^2\omega_0^2} \cdot \cos \frac{n\omega_0 T}{2} + \sin \frac{n\omega_0 T}{2} \left[ \frac{4A}{Tn\omega_0} - \frac{2A}{Tn\omega_0} + \frac{6A}{Tn\omega_0} \right. \\ \left. + \frac{4A}{Tn\omega_0} \right]$$

$$- \frac{8A}{T^2 n^2\omega_0^2} \cos n\omega_0 T - \frac{8A}{Tn\omega_0} \sin n\omega_0 T$$

$$= \frac{4A}{n^2\pi^2} \cos n\pi + \frac{6A}{n\pi} \sin n\pi$$

$$- \frac{2A}{n^2\pi^2} \cos 2n\pi - \frac{4A}{n\pi} \sin 2n\pi$$

If  $n = \text{even} = 2, 4, 6, \dots$ ;  $\cos n\pi = 1$

$$\cos 2\pi n = 1$$

Problem 1.9 p.3/3

1.11

$$F(\omega) = \int_{-\infty}^{\infty} f(t) e^{-i\omega t} dt \quad (1)$$

since  $f(t) = 0$  for  $t < 0$ , Eq. (1) becomes

$$\begin{aligned} F(\omega) &= \int_0^{\infty} f(t) e^{-i\omega t} dt \\ &= \int_0^{\infty} e^{-t} e^{-i\omega t} dt = \int_0^{\infty} e^{-(1+i\omega)t} dt \\ &= \frac{1}{-(1+i\omega)} e^{-(1+i\omega)t} \Big|_0^{\infty} \\ &= \frac{1}{1+i\omega} \end{aligned}$$

1.12

$$\begin{aligned} F_s(\omega) &= \int_0^{\infty} f(t) \cdot \sin \omega t dt ; \omega > 0 \\ &= \int_0^{\infty} e^{-at} \sin \omega t dt ; a > 0 \\ &= \left[ \frac{e^{-at} \{-a \sin \omega t - \omega \cos \omega t\}}{a^2 + \omega^2} \right]_{t=0}^{\infty} \\ &= 0 - \left\{ \frac{e^0 [0 - \omega]}{a^2 + \omega^2} \right\} \\ &= \frac{\omega}{a^2 + \omega^2} \end{aligned}$$

1.13

$$F_s(\omega) = \int_0^\infty f(t) \cdot \sin \omega t \cdot dt ; \omega > 0$$

$$= \int_0^\infty t e^{-t} \sin \omega t \cdot dt ; t \geq 0 \quad (1)$$

From Tables of Integrals, Eq. (1) can be expressed as

$$F_s(\omega) = \left\{ \frac{t e^{-t}}{\alpha^2 + \omega^2} (\alpha \sin \omega t - \omega \cos \omega t) \right.$$

$$\left. - \frac{e^{-t}}{(1+\omega^2)^2} [(1-\omega^2) \sin \omega t + 2\omega \cos \omega t] \right\}_{t=0}^\infty$$

with  $\alpha = -1$ .

$$= \left\{ \frac{\infty \cdot e^{-\infty}}{1+\omega^2} (-\sin \omega(\infty) - \omega \cos \omega(\infty)) \right.$$

$$- \frac{e^{-\infty}}{(1+\omega^2)^2} [(1-\omega^2) \sin \omega t + 2\omega \cos \omega t]$$

$$\left. - 0 + \frac{e^0}{(1+\omega^2)^2} [0 + 2\omega] \right\}$$

$$= \frac{2\omega}{(1+\omega^2)^2}$$

1.14

$$F(\omega) = \int_{-\infty}^{\infty} f(t) e^{-i\omega t} dt \quad (1)$$

For  $f(t) = 0$  when  $t < 0$ , Eq.(1) becomes

$$\begin{aligned} F(\omega) &= \int_0^{\infty} f(t) e^{-i\omega t} dt \\ &= \int_0^{\infty} e^{-at} e^{-i\omega t} dt \\ &= \int_0^{\infty} e^{-(a+i\omega)t} dt \\ &= \frac{1}{-(a+i\omega)} \left. e^{-(a+i\omega)t} \right|_{t=0}^{\infty} \\ &= \frac{1}{(a+i\omega)} \end{aligned}$$
